Carbide Tipped Side Milling Cutters

For non-ferrous material:

- Use for production milling of aluminum, magnesium, zinc, brass, bronze, plastics and non-metals
- Very large flute capacity assures good chip flow and permits high feed rates.

For cast iron:

- Use for heavy production milling of cast iron and malleable iron
- Large flute capacity but more teeth permits high metal removal at moderate speeds and feeds

- **For steel and tougher, harder alloys:**
- Steel cutting grade of carbide permits the heavy chip loads recommended for milling steel

Accepts Internal Hex Rotary/ Punch Broaches

Applications: For use on any type of CNC or manual turning, milling, drilling or screw machine.

Features:

- The holder has an internal live spindle, which holds the end cutting broach tool
- The centerline of the cutting tool is offset at 1° from the centerline of the workpiece
- This offset causes the broach to wobble creating a shearing effect as the broach is advanced into the workpiece or vice versa.

CERMET

Of uniform structure and composition, CERMET is composed of titanium carbide (TiC) and titanium nitrade (TiN) with a super-alloy metal binder. CERMET has a low friction coefficient which eliminates built up edge and improves surface finish. Its high resistance to thermal deformation and its low conductivity make higher cutting speeds possible and result in lower flank wear and edge cratering. Its high degree of hardness and toughness, with resistance to oxidation, extend tool life.

PCT20:

- Of TiCN alloy, good red hardness, high wear resistance, and good oxidation resistance.

Physical Properties:

- Hardness: 91.8/92.5
- Strength: 1700ISO
- Grade: K05/K10/M10/P05/P15
- Typical Applications: Suitable for finishing and semi-finishing of low-alloy steels and stainless steels.

Ceramic Inserts

ISO 9001

Application Data
Use the strongest shape and largest nose radius possible. Round and square inserts should be used whenever possible since they are stronger than diamonds and triangles. For heavier cuts, 5/16" thick inserts are recommended. Use the largest lead angle possible. Use the largest side cutting edge that the shape of the workpiece allows. As the side cutting angle is increased, the length of the cutting edge that contracts the workpiece is increased and the load is distributed over a greater area of the cutting edge. Use proper edge preparation techniques. Proper edge factors in successfully applying ceramics over a wide range of materials and applications.

PCA-2 is Hot Pressed Black Ceramic
Roughing and finishing of hardened steel and chilled cast irons, and for machining cast irons with sandcast scale. Also clean irons or steel of hardness below 425 BHP or about rockwell C-45.

PCH-1 is Hydrostatic Pressed White Ceramic
Used for roughing and finishing of cast irons, carbon and alloy steel, ferritic and martensitic stainless steels, and annealed tool and die steels. Inserts demand a rigid setup in machining operations and are not suited to milling or machining very hard iron or steel.

High Pressure Disconnecting Pliers

To disconnect the hydraulic coolant hose, follow two safe and easy steps:

1. Plase the thinner section of the wrench-nose between the coolant hose and the connector
2. Close the wrench and it will disconnect notch 1 of the coolant hose. Use the thicker section of the wrench-nose and close again to disconnect notch 2.

Criterion TFX & CFX Boring Bars

Steel Shank

- Designed to accept either a flat top or a chip-controlled insert
- These bars are equally effective for internal bores as well as OD turning.
- The offset head permits an easy disposal of chips and a more than adequate coolant flow
- Features ground shank diameter for use in round holders and four flats for use on a flat surface — such as a turret-post holder
- When held in a round holder their 3-point contact assures solid clamping and maximum holding power and the set screw flats place the cutting edge on the exact centerline of the bar

D-GRIP KGTN/R/L Cut-Off and Grooving Inserts

The cutting forces help lock the insert firmly into place and increase the grip on the insert. Removal is possible by using a tool at the back of the insert. The unique chip breaker design of the insert shapes the chips which are narrower than the slot. The system has a cut-off capacity up to 23" diameter. KGTN neutral, KGTL left hand, KGTR right hand

Notes on Selecting Insert Size

- Use 8° to reduce burr size
- Use KGTN 0° for flatness of surface, chip flow, large depth to width of cut ratio and high feed rate
- Use 0° and 8° for tubing

Lead angle: standard and neutral 0°, right 8°
See below for carbide grade selection chart

Carbide Grade Selection

For steel cutting
DC340 (C5) recommended for machining steel, austenitic stainless steel, machining to center, and interrupted cuts.
DC740 (C5-C6) TiC+TiCN+TiN coating, recommended for interrupted cuts, machining of steel, austenitic and martensitic stainless steel and pipes.

For cast iron and non-ferrous materials
DC210 (C2-C3) recommended for cast iron, non ferrous materials and plastics.

NIKCOLE MINI-SYSTEMS™ Grooving and Cut-Off Inserts (GIE-7-GP)

Nikcole Mini-Systems™ is the only system that provides two cutting edges in one insert in extremely narrow widths. This system also features a full range of toolholders with minimum hardware...only one positive locking insert screw and the unique insert pocket design assures a repeatable cutting edge location.
Standard inserts are stocked in widths from .019" to .078" in uncoated and coated carbide grades.
The Mini-System™ is a unique method of producing narrow grooves and providing an economical means of cut-off...all in a wide variety of materials.
For grooving and cut-off under .078" width.

Carbide Grade Application
C2 - Uncoated grade recommended for cast iron and non-ferrous materials.
C5-PV - Coated grade recommended for machining steels, cutting solid bars to the center and for interrupted cuts.
C6-PV - Coated grade recommended for machining steels, cutting off and grooving at higher speeds.

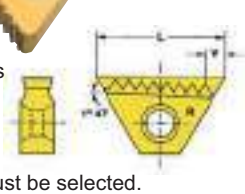
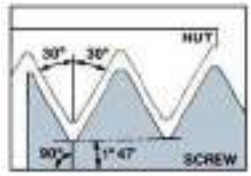
VARGUS USA External & Internal Inserts

ISO 9002

American NPT

- For CNC machining centers and milling machines
- Work for making a thread on a non-rotatable bulky part
- Higher machine speeds
- Multi-tooth type inserts
- Less downtime and tooling changes
- Less machine power required
- Better thread surface finish yields better sealing and engagement
- No undercut is necessary due to CNC control accuracy





NOTE: milling inserts can be used either right hand or left hand. However, appropriate holder must be selected. Right hand is standard, left hand is available on request.

The American Standards Association has adopted a uniform system of wheel markings for easy identification of the elements which have been built into a grinding wheel. Each marking consists of six parts in the following sequence.

1. Abrasive Type & Manufacturer's Prefix
2. Grit Size
3. Grade of Hardness
4. Structure
5. Bond Type
6. Manufacturer's Specific Bond

Diamond & CBN Mandrels

- Diamond & CBN pins are widely used on jig and internal grinding machines, cylindrical grinding machines and hand tools
- These pins are used for internal grinding operations of dies, special punches, cutting tools as well as numerous parts of stainless steel, exotic super alloys, etc.
- Grinding pin shanks are hardened to 42-55 Hrc and are center-less ground to ensure a rigid, accurate, concentric and parallel pin blank
- Grinding pins are all electro plated by a very precise and environmentally safe process
- Diamond and CBN powders are carefully selected and treated for precision and consistency
- Diamond pins are used for grinding tungsten carbide, ceramics, glass and non-ferrous materials
- CBN pins are used for grinding high-carbon, high-chrome steel, high speed steels such as M2, M3 and die steels such as D2

Grease Sticks

For Coated Abrasive Belts and Discs

MJ61F26 All Purpose Lubricant for Belts & Discs - A lightbodied grease — that spreads out thinly —remains "wet" on the belt — and provides lubrication by penetrating the coated abrasive surface. Prevents clogging and leaves the abrasive grit free to cut clean and smooth. Recommended for all belt polishing operations — on all metals, plastic and glass

MJ61F90 White Tallow Base Lubricant with High Melting Point - Serves as a lubricant and, at the same time, fills and closes the belt with a heavy bodied grease film. When applied to fine grit size coated abrasive belts it permits a glazing or burnishing action. When applied to coarse grit belt operations the grease film is heavy enough to stay on the belt under severe conditions

MJ61F122 Mixture of Belt Grease & Aluminum Oxide Buffing Flour - Recommended for Belt Polishing Operations on Stainless and Carbon Steel. A mixture of belt grease and unfused, aluminum oxide buffing flour. The grease base serves as a lubricant, and the abrasive flour functions the same as a buffing compound "Coloring Agent" to impart luster to the polished work. Particularly recommended for belt polishing operations on stainless or carbon steel when a high quality, bright finish is desirable

MJ61F115 Mixture of Belt Grease & Tripoli Abrasive - Recommended for Belt Polishing Operations on Non-Ferrous Metals. Coated abrasive belts, used for polishing such non-ferrous metals as zinc or aluminum die casting are too often discarded long before their useful life is expended simply because they become loaded with metal particles. The Tripoli abrasive blended with the grease base of Order. No. MJ65-F115 serves to fill between the abrasive grains on the belt, and minimizes this metal loading condition. In addition, the Tripoli abrasive itself functions as a buffing compound "coloring agent" in bringing out a brighter luster than is obtainable with a straight grease lubricant

MJ61F200 Wheel Wax - A new crystalline wax formulation combined with a unique, dry, inorganic, lubricating additive. Permits super-fine grinding, polishing and finishing

Suggested RPM

The Flex-Hone tool is a low RPM tool. Specific RPM is dependent on the diameter of the tool and the application. General speed ranges are given but, again, machine trials are required to verify the parameters. Hone Dia. RPM

19“ to 36“ 60-120 RPM
12“ to 18“ 80 to 350 RPM
8“ to 12“ 300 to 500 RPM
4“ to 8“ 400 to 600 RPM
2“ to 4“ 600 to 800 RPM
1/2“ to 2“ 700 to 900 RPM
4mm to 1/2“ 800-1200 RPM

Remember:
The Smaller the hone, the faster the speed.
The larger the hone, the slower the speed
